

Success with Equitonic Therapy:

Tendon Scar Tissue

A 9 month old filly, spooked and hit extensor tendon on left leg over fetlock joint. Within one week tendon showing thickening. Did not respond to wraps or sweats. Treated with Infratonic 20 minutes per day, 5 days per week (M) then 10 minutes per day, 5 days per week. Reduction in thickened area on tendon about 80% in 6 weeks. Now about 90% reduction in tendon size. Joint almost looks normal.

Tammy Opperman - Whitesburg, GA

Lameness

My patient is my 7 year old expensive Oldenburg Dressage mare, imported and beautiful. She had developed ring bone and upward fixation of the patella ligament. After using the Equitonic on her 5 times for 45 minutes each treatment, she was on her road to recovery.

Tisha Green - Park City, UT

Swelling & Pain

Horse, contusion and ligament damage to joints when hoof was caught in high fence after horse reared up. Two days after the incident, the Infratonic was applied to the forelimb, which was swollen, torn, hot and tender to touch. The immediate results of the Infratonic application were reduction in swelling and tenderness, which did not return.

Mary Berry, DC - Richland Hills, TX

Performance

I found a claimer for \$5000. He had originally been purchased for more than \$500,000, but in races, he would repeatedly go to the front of the race, then stop. We knew he had class because of his breeding, so we took a chance. After a week of Equitonic treatment, we put him in a \$10,000 claimer, and he won the race by 5 lengths. With continued treatment, (3 times per week along lung meridian and for soreness) he got better and better, so I entered him into a 1-3/16 mile roman and he won it by 12 lengths.

Jerry Pinkowski

Fracture

Fracture of tibial crest with open wound to joint of thoroughbred horse. Told by several vets that horse would never be sound to ride except for trail at a walk. After 8 months and three sets of x-rays no apparent change. Used the Equitonic for one month, every other day, for fifteen minutes to one half hour. I held the transducer directly over the fracture. In only that one month, x-rays taken again. Vet said I don't know what you're doing, but don't stop. The fracture has almost healed and almost all of the arthritis was gone. You should see him run and buck and play and never take a sore step.

Relieve Pain and Reduce Drug Use... While Accelerating Healing!

With the EQUITONIC 3

Monarchos wins the 2001 Kentucky Derby,
in the second fastest time ever. His trainers used
the Equitonic daily before the race.

With the Equitonic 3 you can reach problem areas untouchable by any other therapy. Millions of wavelets, unpredictable massage pulsations, penetrate deep into the tissue and break up patterns of pain, inflammation and degeneration while promoting healing. This remarkable therapy, supported by controlled equine research, gives you the racer's edge with accelerated recovery from injury and improved performance, even with strenuous workout schedules.

Q: How does the Equitonic work?

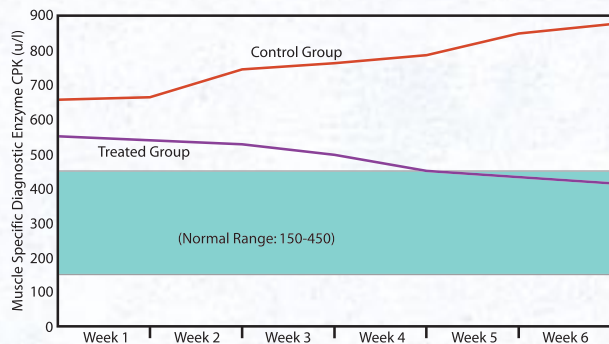

Body tissues communicate using vibrational signals. When cells are shocked or traumatized, they often respond with abnormal behavior like inflammation, edema, pain, or impeded healing. The Equitonic produces millions of unpredictable wavelets which penetrate deep into the body breaking up the abnormal behavior to:

- **Relieve Pain**
- **Reduce Inflammation and Edema**
- **Accelerate Healing**

Q: That's great, but do you have any proof?

CPK and AST are two muscle enzymes that are elevated in tissue that has been injured or subjected to trauma.

The following graph illustrates a controlled study using 20 standardbreds. Those treated with the Equitonic show a dramatic drop in enzyme levels.

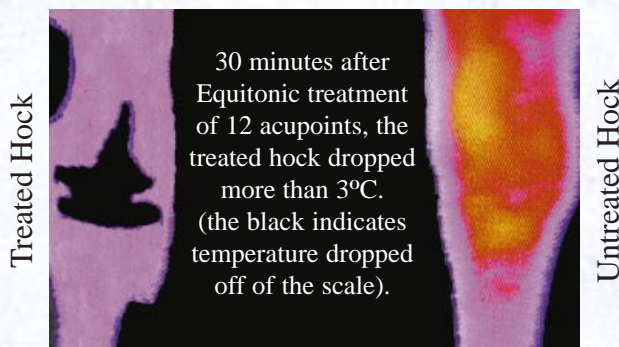

The 10 treated horses improved during the study while the control group worsened.

RESULTS: TREATED HORSES RAN AN AVERAGE OF 6 LENGTHS FASTER AFTER JUST 6 WEEKS!

Q: How about joint inflammation?

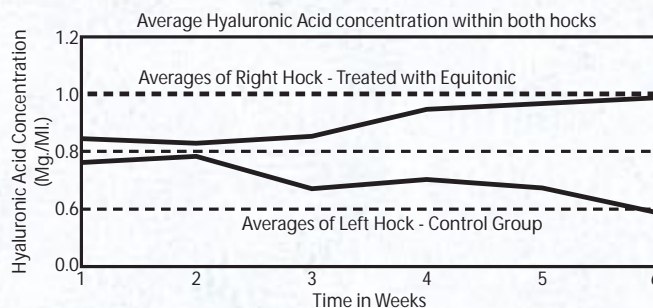

“Sore hocks” is something every trainer hears over and over again. The Equitonic clears inflammation like no other modality. The thermographic image below clearly shows a marked drop in inflammation of the treated hock.

Q: What exactly is happening in the hock?

Inflammation in the hock impedes the production of Hyaluronic acid, an important lubricant and building block for healthy cell walls, tendons, and cartilage. HA is frequently injected as a treatment for joint therapy.

The Equitonic reduces inflammation so that the cells in the synovial tissue produce more hyaluronic acid. The following graph illustrates the HA increase in a controlled study with 10 standardbred horses.

RESULTS: LESS INFLAMMATION = BETTER LUBRICATION and HEALTHIER JOINTS!

Q: How does the Equitonic compare to other modalities?

Recently, the Horse Journal published an article comparing high tech therapies including laser, LED, magnets, PEMF, ultrasound, electrical stim, and the Equitonic. For acute joint problems, they concluded:

“CHI Machine, [The Equitonic from CHI Institute] is the choice here as the only device that is 100% safe and effective on acute problems.”

They also wrote that the Equitonic is:

“Best suited for: Acute swellings/inflammation (joint, tendon, muscle, wound); arthritis; myositis; spasm; back pain regardless of cause; stimulation of acupuncture meridians.”

(Horse Journal, November 2001, p17-18)

At half the cost of ultrasound, and 100% safe, the Equitonic is the best value in Equine therapy on the market today.

Q: Are there other Equitonic devices?

The only other devices anything like the Equitonic are analog devices developed in the 1980's, which are sometimes sold under names misleadingly similar to the CHI trademarks, but the Equitonic with patented digital technology is, by far, the most effective equine unit of its kind available today.

Q: Does the Equitonic have a warranty?

Yes, a 2 year warranty is included on each unit. Repairs and technology upgrades to units out of warranty are also available for an inexpensive fee.
